1 EVALUATING, THINKING AND READJUSTING

This method allows you to:
- Adjust according to the project's evolution
- Everything moves constantly, adjust to what's happening to meet the needs accordingly
- Understand what works and what doesn't
- Know what's left to do and what has already been done

What you can do:
- Evaluate your actions and the methods you're using to reach your goals
- Collect the necessary information for evaluation in your documents (action plan and general and specific objectives, budget, results obtained in the field, etc.)
- Stay flexible, adapt to what's happening and have a plan B.

Examples: having a backup activity, relocating or modifying the date of an event
- Keep realistic expectations and remind participants of what is realistic and what isn't
- Conduct a simple evaluation of the activities that were carried out

Briefly ask questions to anyone who participated in the creation or the activity itself. Ask your group what were the results achieved after the activity. Base your reflections and questions on the goals you have established.

To better understand the results of our actions, it's important to conduct a qualitative and quantitative study about the benefits of our initiative. It's also the best way to get better and learn from our mistakes for future projects.

This method allows you to:
- Learn from your mistakes and focus on what worked
